

Engineered Products: Aluminum Formed Tubes and Assemblies

In many industries where the subject of weight has become an increasingly important factor, the use of aluminum in the production of formed tubes and assemblies has grown steadily. EPC's experience with aluminum tube reveals part production that requires spinning, intruding, extruding, forming, bending and expanding. Products include: return bends, headers, formed tubes, distributors, connectors, assemblies, tees, elbows and couplings. Generally, everything in non-ferrous metals described on previous pages can be accomplished in aluminum.
