

## Engineered Products: Formed Tubes to specification

What the engineer creates, what the drawing board reveals, EPC can produce in formed tubes of innumerable shapes and sizes. This productive talent is the combination of years of practical experience coupled with a large tool and equipment inventory. Cost saving advantages are clearly evident by the elimination of brazed joints and our ability to build full, tight radiuses. These features also aid in preventing potential field failures. Formed tubes are produced from these metals: Copper, Brass, Aluminum, Cupro-Nickel and Stainless Steel.
